margins on third and fourth segments are plumose. First segment, as viewed from above, long trapezoilal, coarsely rngoso-punctate, lateral tubercles large, its length less than twice breadth at apex, with plumose hairs on basal margin only, rather strongly constricted at juncture with second segment, ventral median ridge with a stout tooth near the basal end; the last two dorsal segments darkened; the last dorsal segment as long as wide at hase, opaque, the dise broadly longitudinally depresied on either side, minutely punctured near the subtrumeate blackenel tip, on either side of which is a tuft of fine golden hair.

The type of this species was taken in Ormsby county, Nevada.
ON SOME IIYMENOPTERA ('OLLEC'TED BY PROF. C. F. BAKER

IN NHCARAGUA. BY P. CAMERON.

## MUTILLIDAE.

## 3427 Sphaerophthalma anthracia Canr.

Biol. Cent. Amer., Hymen. 11, 352. (hinandega.

## $170 s$ Sphaerophthalma caroli sp. nov.

Black, the front, the vertex broadly-the mark rounded and marrowed behind, the thorax above, exeept for a triangular lhark mark in the centre at the base, the mark orcupring the entire hase of the thorax and with its apex rounded, the apical mark breadly rounded above extending to the middle of the metanotum which has the apical half entirely black, two moderately large oval marks on the base of the second abdominal segment and two domble their size nearer their apex, of reddish orange pubescence; the sides of the third, fourth, and fifth segments broadly covered with silvery pubescence, darkened slightly with a golden tint; the regidium covered with long dark fulvous pubescence and transversely striated; the hair on the sides of the head, thorax, and ventral surface silvery. Female. Length 12 mm .

The third joint of the antemnae is as long as the following two united; the fourth and fifth are brownish beneath. Head wider than the thorax, the temples as long as the eyes; the oceiput almost transverse, not keeled, the sides rounded. Thorax fidlle-shaped, the anterior and larger part wider than the posterior, rommled, the sides without distinet teeth. Mesonotum rugosely pmetured, the metanotum reticulated, the sides in the middle with three or four small teeth. Pleurae smooth, the apex with a ponctured band, which is dilated in the middle. Calcaria and tarsal spines hright rufous. Abdomen sessile, as long as the head and thorax miterl.

Comes near to $S$. phedyma Cam., and to $S$. verticalis Sm., with which it agrees very closely in the arrangment of the pubescent markings. The former may be known from it by the occiput being clearly transverse and with the sides projecting into a keel, the orange on the metanotum too, is not continuous but divided broadly into two parts; the latter has a stont, longish central tooth with a shorter rounded
one at its base and apex, on the sides of mesonotum at the base, and the sides of the occiput are more broadly roundly narrowed. San Marcos. 3430 Ephuta chinandegae sp. nov.

Black, thickly covered with longish silvery hair and with silvery pubescence; the two basal abdominal segments with a broad band of silvery pubescence on the apex; the coxae, tibiae, and tarsi thickly covered with silvery pile; the femora sparsely haired, the calcaria and tarsal spines white; wings fuscons, highly iridescent, the nervures and stigma black. Male. Length 6 mm . Chinandegat.

Antennae stout, the flagellum rovered with a pale pile; the scape more shining, sparsely covered with white hair, hollowed beneath, the sides stoutly keeled; the first joint of flagellum narrowed at the base, about one-half longer than the second.

Front and vertex strongly punctured, the punctures clearly separated. Eye incision large; face and clypeus smooth; mandibles with a broal rufous land near the mildle, their base thickly covered with white pubescence. Mesonotum coarsely rugosely punctured, almost reticulated, the reticulations in the middle near the apex longer than the others. Scutelhm closely rugosely punctured, thirkly covered with white pubescence, longer than it is wide at the base, the sides straight, the apex rounded. Central area on liase of metanotum large, about three times longer than wide, of equal width, with the apex rounded; the apex of the segment has a straight, ohlique slope. The abdominal petiole nearly as wide at the base as it is at the apex, the latter clearly separated from the second segment, its ventral keel blunt, not dilater, clearly separated at the base. Pygidium irregularly panctured, the third and following dorsal segments keeled in the middle, the keel on the thirl and fourth shorter, not extending near to the base of the segment. The fourth abscissa of the radius slightly shorter than the basal and more stecply sloped, the third is not as long as the first and seconit united, the first recurent nervure is received shortly, but distinctly beyond the middle, the second in the middle.

This is an "Ephuta'" as defined by Dr. Ashmead, Canad. Ent. XXXVI, page 7 .

## TIPHIDA.E.

## 3437 Paratiphia fuscipennis sp. nov.

Black; the mandihles and apical joint of the tarsı rufo-piceons, the calcaria white, the tarsal spines bright red; the pubescence white, on the last ablominal segment fulvous; wings and nervures fusmous. Female. Length nearly 7 mm . San Mareos, Nicaragua.

Flagellum of antennae brownish helow, covered with a microscopic pile. Head above the antennae strongly punctured, more closely ant with the punctures smaller and more closely pressed together on the lower part of the front than on the vertex. Pronotum except at the apex covered with large, deep, roundish punctures; the mesonotuu
with the punctures larger and more widely separated; the seutellum has them smaller: the postscutellum is almost impunctate. The later:al keels of the widdle area on the metanotum are roumdly corsed out. wardly and do not mite at the apes: the central one does not quite reach to the aprs outsitle it; on the basal half is a shorter less distinet keel; the space between this and the onter keel is finely, irregularly, transversely striated; the segment, ontside the area, closely striateri, the striae ollique, eurved, and beooming stouter towarts the apex. [pper part of proplenae strongly punctured, the lower ohscurcly rugose, with some swattered punctures; exceut at the base the mesopleur: ? are strongly lut not very elosely punctured and shining; metapleurae ohliquely, distinctly striated, the striae clearly soparated and weakey below the millle. Basal segments of abdomen sparsely, the apical more closely and strongly punctured; pygidinm closely, finely punctured, except round the sidesand apex; the central part obscure red; the hypopygium smooth in the centre, the sides pmatured.
3434 Tiphia marcosensis sp. nov.
Black; the underaide of the flagellum of antennae and the fore tibiat and tarsi rufo-testacems; wings hyaline, the nervores and stigma black; palpi fuscous; vertex and front closely and strongly punctured, a smooth space helow the ocelli and a short smooth line in the rentre of the front. Fare rlosely rugose; the rlypeus distinctly punctured, ifs apex in the rentre clearly defined, not quite transverse; the rertex at, the sides of the orebli smooth, bare, and shining. The whole head thickly rovered with white hair. Pronotmm, except for a smooth curved band on the apex, strongly, lut not very closely punctured. Mesonotum more strongly punctured, the pumetures widely separated, the lateral furrow smooth, moderately narrow and deop, and slightly curved. Scutellum n wh more closely fanctured, if mot quite so strongly; there is a small triangular smooth space in the middle at the apex. Basal half of postsentellum punctured distinctly and closely, the apical half smooth. Netanotum with three keels, the lateral slightly converging towards the apex, smooth and shining, the base of the lateal part obscurely punctured. First abdomiual segurent shining, rather strongly punctured; the apieal transserse furrow narrow and smooth. The furrow on the base of the sefond segment distinct, strongly striated; the second segment is ohseurely punctured, the third and fourth at the basal half smooth, the apical smooth; the others closely, strongly punctured. Wings hyaline, iridescent, the hasal and apical abscissae of the radius roundly curverl; the first transversie "ul: :al nervire straight, not oblique; the second shaped like a reaping hook, the "handle", on the lower side, about one-fourth the size of the rest. The first recurrent nervure is received shortiy berond the midd o of the rellule, the second near the base of the apical fourth. C'alcaria ant tarsal spines white. The metanotum appears shorter than usual, being only as long as the scutellum. Male. Length 7.5 mm . San Marcos.

## 3433 Tiphia granadaensis sp. nov.

Black, rather densely covered with white hair; the flagellum of antennae rufo-testaceous; centre of metanotum with two keels which converge slightly at the apex; wings clear hyaline, the nervures and stigma black. Male. Length 5 mm . Granada, Nicaragua.

Lower part of front, face, clypens and hase of mandibles densely moved with silvery pubescence; the front and vertex punctured, the former more elosely and not so strongly punctured, its base bordered by a stout keel. Mesonotum sparsely punctured, most strongly in the centre, the apex in the middle with an oblique slope. Scutellum sparsely indistinctly punctured. The central area on the metanotum is smonth, the two keels at the base are slightly curved outwardly; in the basal half is a stout keel, with a minute one on either side; on the sides, inside the spiracles, is a double curved keel. Pleurae sparsely pilose; the metapleurae hare, shining, irregularly longitudinally striated. Across the apex of the petiole is a crenulated furrow; the base of the second segment is depressed and striated; the apical segments are densely covered with longish white hair. The fore tibiae and tarsi are testaceous. The hassal abscissa of the radius has a short basal and a longer straight apical curve; it is not much shorter than the second, the third is the shortest and is roundly curved at the apex; the second transverse cubital nervure is broadly roundly curved. The furrow on the sides of the mesunotum is narrow and rondly curved. Palpi dark testareous. Mandibles blackish. The sontellim is distinctly punctured, except the sides in the middle; the postscutellum is more uniformly punctured.

Comes close to T. testaceipalpis Cam. (Invert. Pacifica, I, p. 69), having like that spceies two keels on the metanotum, if we do not count the half length keel on the basal half.

## ICHNEUMONIDAE - MESOSTENINI

### 346.5 Mesostenoideus bakerianus sp. nov.

Black, the face, clypus, inner orbits, the lower half of the outer orbits entirely, malal space, the base of the prothorax, a broad band on the edge of the pronotum, tegulae, a conical mark-the base trans-verse-the apex narrower and rounded, scutellum except on the basa! slope, its keels, postscntellum, the sites of the metanotum broadly, the marks covering the spines, tuhercles, the lower half of the mesopleurat, the mesosternum exrept the furow, a large mark below the bind wings, the lower half of the metapleurae and the apices of the abdominal segments-the hamds on the second and third broader than the othersyellow. Legs pale yellow; all the femora hroadly black above, the trochanters spotted with black; the fore coxae black below, the two posterior broadly black in the middle above; the apical joints of the four fronttarsi blark. Wings hyaline, the stigma and nerrures black. Antennac broadly ringed with white. Female. Length 12 mm ; terelra 4 mm . Chinandega, Nicaragua.

Shining. There is a stont kee] dewn the middle of the front, with short irregular ons on citlar side of it close to the ocelli. Face and clypeus with sone scattered punctures, the former with some irregular striae on the dilated centre alove. Pronotum dilated near the base. Mesonotum stronsly, hat not rery closely pmetured, the hase of the three lohes almost snooth, the sides of the central striated near the base. Base of scatelium strongly, but not closely punctured, the apex almost smooth; the centre, between the spines, irregularly obliquely striated, the apical slope more strongly transversely striated. Tpper part of metapleurae strongly, closely, obliqnely striated, the striae interlacing in the middle; the lower part punctured and striated. Apex of propleurae al ove the midde rather strongly striated, the top punetured. Mesopleurae punctured helow, the hase striated; the apex below strongly, obliquely striated, almost reticulated. Abdomen smonth. Tarsi closely spinose.

## MESOLEPTINI.

## 3167 Neleothymus (?) rufo-ornatus sp. nor.

Black; face. clypens, the eye orbits (more broadly before than behind), mandibles except at the apex, palpi, twe lines ohliquely dilated on the outerside on the lasal half of the mesonotum, tegulae, scutellum and tubercles, lemon-yellew; the apices of the third, fourth, and fifth abdominal segments rufo-tistaceous; the upper half of the propleurae and the apical balf of the milalle lobe of the mesonotum sanguineous. The four front legs tistaceons, paler, more yellowish in front, their coxac and trochanters lemon-yellow; the hind coxae and trochanters black, rellow at the apex; the femora red, their tibiae blackish, broadly yellew in the middle alere, the tarsi blackish, Wings hyaline, the costa fuscous, the nervores and stigma darker colored; the recurrent nervure is received shortly beyond the only transverse enbital nervure, there being no areolet. Naie. Length 8.9 mm . 'hinantega.

Face and rheeks punctured, thickly coveren with silvery pile, the clypeus more shining, ohscurely punctured only above, clearly separated from the face. Thorax closely, distinctly punctured, thickly covered with a silvery pilo. Sentellum flat, punctured, keeled laterally at the base. Median segment regularly areolated, the areola longer than wide, five-anglet, the base sha:ply pointed, the apex transverse; the spiracles minute, oval. The metas'ornum herlered by a stont keel. Fore tibiae very long, the hasal $t \pi$, joints united heing longer than the tibiae. Wings short, the stigma 'arce, the radius ieaving it shortly beyond its middle; the transverse edian nervure interstitial. Antennae shorter then the abdomen. hlack, the hasal two joints yellowish below. Fifth tarsal joint lenger than the fourth.

In the absence of : fo nale $I$ am not quite certain as to the generic position of this species in the Foersterian-Ashmeadian system.

## VESPIDAE.

## 3446 Eumenes nicaraguaensis sp. nov.

Black, the greator part of the eye incision, a narrow line on the top of the outer orbits, a line on the sides of the clypeus above, the basal third of the mandibles, a conical mark above the antemnae, its narrow end above, a line along the base of the propleurae, one along the upper edge of the pronotum all round, uniting in the middle with the lower oblique line, a narrow line on the base of the scutellum, post-scutellum, a line on the centre of the narrowed base of the first ahdominal segment, a narrow line on its apex, with a mark touching the base of the line on the sides anil a broader more irregular line on the apex of the second, hright yellow. Wings fuscous, highly iridescent, the nervures and stigma black, the latter shining. The lower part of the front, eye incision, face and clypeus pale golden, the pubescence on the rest of the bodv silvery. Male. Length 6 mm . to end of second abdominal segment. Chinandega.

Front and vertex strongly but not closely punctured except at the sides of the antennae. Antennae stont, a narrow yellow line on the apical half of the scape; the claw stont, slightly longer than the apical joint. Clypeus smooth, indistinctly punctured in the middle, the apex distinctly projecting in the middle, the projection twice wider than long, its apical half roundly incised. Thorax strongly and moderately elosely punctured, except at the base of the metapleurac. Median segment broadly rounded, the apex with a steep slope and not furrowed. The oblique furrow on the mesopleurae is deep and clearly defined. Abdominal petiole clearly longer than the head and thorax united, its dilated pyriform apex about one-fourth shorter than the narrowed basal part, its lower surface is for the greater part sordid yellow, and there is a distinct transverse furrow close to the apex; the second segment campanulate, clearly longer than its wirth at the apex. Legs black, the knees and apex of fore tibiae testaceous. Body shining, polished, the thorax short, cubital in front, glohular behiud, more than twice the length of the "pear" of the petiole. Ocelli almost in a straight line. The second cubital cellule is narrowed in front, not quite half the length it is behind; the third is large and is clearly wider in front than behind.

Belongs to Saussure's Division Omicron (Syn. of Amer. Wasps, p. 70). It seems to be sufficiently differentiated from "regulus'" by the longer clypeus compared with its width, it heing also wider above. not so clearly narrowed and its anex is charly bidentate. Judging by Saussure ${ }^{\circ}$ figure (Pl. I, f. $i$ b) the abdominal petiole is longer compared with the hearl and thorax; in regulus it is shorter than the head anl thorax; in the present species clearly longer than the two combined. The second recurrent nervure is not interstitial as it is in $E$. totonacus; in that species, too, the antennal hook is "very small." $E$ aviculus should, inter aile, be known by its strongly puncture.t abdomen.
